HYPERSPECTRAL AIRBORNE SURVEY – PEAK HILL, WA

Aurium Resources Limited is pleased to announce that the hyperspectral remote sensing airborne survey, flown by HyVista Corporation Pty Ltd (“HyVista”) has been completed.

The airborne survey covered 20 tenements in the Peak Hill Mineral Field, which is north of Meekatharra. The tenements are either 100% owned by Aurium or in Joint Venture with Greater Pacific Gold Ltd (GPN). The survey area covered more than 2,089 km².

The hyperspectral survey will provide the Company with high resolution, detailed maps of the surface mineralogy, which are essential in the search to identify Iron Oxide Copper Gold Uranium (IOCGU) mineralisation.

The survey was flown by a fixed winged aircraft about 2,000 metres above the ground with an imaging spectrometer attached to the aircraft. Sunlight reflects a frequency from the earth’s surface and the frequency data is captured by the spectrometer every five square metres.

The detailed map of the tenement geology will assist the Company to prioritize future uranium and gold targets.

The survey is part of the long term exploration strategy and will add vital information to the Geophysical Information System database (GIS).

HyVista and the Company Geologist, Mr Brian Davis, will analyse and interpret the data and construct a detailed tenement map of the surface mineralogy.

Further details about HyVista can be obtained from their website; www.hyvista.com
